about them. His personal interest in his students was greatly appreeiated, and he was universally well liked by them.

The writer beeame aequainted with Mr. Hankinson while he was a student at the Miehigan Agrieultural College in 1897. We were both elected Assoeiate Editors of the Bulletin of the Michigan Ornithological Club, where in Volume 1, Number 1, pages 1-4, was published his paper on "Progress of Ornithology in Miehigan", a very eomplete outline of the work that had been aceomplished up to 1897 , giving the names. dates, and lists published by the early ornithologists of the state. While other intercsts oeeupied most of his time, he has always been greatly intercsted in birds, and he has furnished the Museum of Zoology with valuable data and some study specimens, all of whieh are here gratefully acknowlcdged. We dceply regret the loss of a valued friend and co-worker of many years standing.

## FREQUENCY OF OCCURRENCE OF SUMMER BIRDS IN NORTHERN MICHIGAN

BY JEAN M. LINSDALE
Twiee I have given detailed accounts of a proeedure for determining and deseribing the frequeney of occurrence of birds on restrieted areas. (See Condor. Vol. 30, 1928. pp. 180-184, and Vol. 34, 1932, pp. 221-226). The method has been worked out for studies of plants, but its applieation to birds is so simple, and the reeords needed for its use are so nearly the same as those ordinarily kept by bird watehers, that it deserves more attention from bird students than it has reeeived.

The materials used here are the result of fifty days' work in the field in the vicinity of Douglas Lake, Cheboygan County, Michigan, in the summer of 1924. The first work was done on June 9 and the last on August 17. During the first threc weeks only a part of caeh day was spent in the field, but in the latter part of the season whole days are represented in the rceords. Spceial attention was given to the nesting lirds and their local distribution. During the summer 106 kinds of birds were found: a few of these were early migrants. Beeause many aeeounts of the environment in this vieinity lave been given by other workers and beeause a detailed analysis of the birds of the region has heen prepared ly Profcssor F. N. Blanehard (MS.).

I intend to discuss only the single topic, frequency of occurrence of the summer birds.

For the kind of analysis attempted herc more rccords are desirable than are available, but I believe that the ranking of the species would not be changed greatly by additional matcrial. It would be useful in studying populations of birds to have comparable determinations of relative frequency of occurrence of the species from many localitics. In this country hundreds of persons have kept rccords of the birds observed by them each in a restricted locality. With very little effort these rccords could be analyzed and concise summaries of them from the point of view of the Raunkiaer law of frequence preparcd and published. Some of the refinements of method suggested by Dice (Auk, Vol. 47, 1930, pp. 22-24) would add considerably to the value of such results; but with most observers it probably is not practicable to apply them. or at least they have not been applied in the records already made.

Raunkiaer derived what he called the Law of Frequence from eleven pieces of botanical work carried on by himself and others in different parts of Europe. In nearly all such surveys it is lcarned that therc are many more species of low frequence than of high frequence. A curve expressing the numbers in the different classes of frequence has two peaks, a high onc expressing the least frequence. and a lower onc expressing the greatest frequence. If the specics of frequences of respectively 1-20 per cent. 21-40 per cent. 41-60 per cent. $61-80$ per cent. and $81-100$ per cent are grouped into classes designated as A. B, C. D. and E, the law of frequence might be expressed $\mathrm{A}>\mathrm{B}>\mathrm{C}>$. equal to, or $<\mathrm{D}<\mathrm{E}$ (Kenoycr. Ecology. Vol. 8. 1927, p. 343).

To avoid duplication of matter contained in previous discussions, I will repeat only a few points which dcserve special emphasis. The importance of studics of bird populations and the difficulties encountered in making them arc commonly recognized. Adaptations of methods developed in conncction with the Raunkiacr law of frequence offer suitable means of analysis of frequency in birds. For this purpose the lists of birds customarily kept by bird watchers provide sufficient matcrials if they pertain to a single limited locality or single type of habitat. Days appcar to be suitable units for observational records, thus shifting the basis for analysis to units of time rather than of space. As to the number of units. this may vary considerably depending upon such factors as sizc and uniformity of the area and scasonal distribution of the time: but I suspect that. where possible.
it is best to have records for one hundred days or more and extending throughout the annual cycle. The percentage of frequency for each species is obtained simply by dividing the number of days on which the species was observed by the total number of days on which observations were made.

Besides furnishing an opportunity for application of the method of frequency analysis to a new locality these records can be compared with another set of figures intended to show the relative numbers of summer birds in the same vicinity. J. S. Compton (Wilson Bulletin,

Fig. 29. Graph showing relative frequency of occurrence of the species of lirds recorded in three localitics: Doniphan County, Kansas (dotted line) : Yosemite Valley, California (light, solid line); Cheboygan County, Michigan (heavy, solid line). Each curve represents the percentages of frequence for all the species in a single locality. For example, the heavy, solid line shows how the percentages for the 103 species recorded in Michigan are arranged between the extremes of 88 and 2. On this graph most frequent species are indicated on the left and least frequent ones toward the right.

Vol. 26, 1914, pp. 173-180) obscrved birds in this vicinity during the summer of 1913 and 1914. Hc used the term frequency to express the "comparative frequency with which the species, not the individual, was scen." In this connection he used three degrces as follows: "r or rare $=$ seen 1 to 4 times; c or common=scen from 5 to 20 times; a or abundant $=$ seen more than 20 times." He cxplained that "abundancc. on the other hand, applies to the total number of individuals of the different speeics seen during a given period; in this case the period covers from June 30 to August 7, stopping before the fall migration gets any headway to disturb our study of midsummer birds. (1) under abundance means that this species stands highest in number of individual hirds scen, 227 in our study; at the other end of the scalc of
abundance (47) means that only 1 bird of this species was identified."
Compton's determinations of frequency and abundance have been placed in the following table (second and third columns) along with my own figures expressing percentage of frequeney (first column) aceording to the Raunkiaer law. Beeause the reeords were made by two separate persons, in different years, and with different objectives the results are not exaetly eomparable. but from the point of view of accurate deseription and eeonomy of time, as well as ease of eomprehension, the pereentage of frequeney seems to be the most satisfaetory.
Table 1. Classification of Speeies Aecording to Raunkiaer's Law and Compton's Determinations.

| Species | Percentage of Frequency | Frequency | Abundance |
| :---: | :---: | :---: | :---: |
| Eastern Robin | 88 | a | 17 |
| Eastern Kingbird | 88 | a | 15 |
| Cedar Waxwing | 84 | a | 1 |
| Eastern Nighthawk | 84 | a | 10 |
| Eastern Chipping Sparrow. | 82 | a | 13 |
| Eastern Song Sparrow... | 78 | a | 2 |
| Red-eyed Towhee | 78 | a | 4 |
| Eastern Crow | 76 | a | 3 |
| Eastern Hermit Thrush. | 74 | a | 9 |
| Spotted Sandpiper | 72 | a | 6 |
| Northern Flicker | 72 | a | 14 |
| Red-eyed Vireo | 72 | a | 5 |
| Fastem Whip-poor-will | 70 | a | 12 |
| Eastern Goldfinch ........ | 70 | a | 7 |
| Brown Thrasher | 68 | c | 26 |
| Eastern Cowbird | 60 | c | 24 |
| Oven-bird | 58 | c | 11 |
| Eastern Belted Kingfisher | 56 | a | 16 |
| Eastern Vesper Sparrow...- | 56 | a | 8 |
| Eastern Wood Pewee..... | 50 | a | 19 |
| Northern Blue Jay.. | 50 | c | 26 |
| Slate-colored Junco | 50 | a | 15 |
| Caspian Tern | 48 | c | 33 |
| American Redstart | 46 | a | 14 |
| Black-capped Chickadee | 44 | c | 21 |
| Eastern Mourning Dovc.. | 42 | r | 46 |
| Killdeer | 40 | c | 23 |
| Eastern Ruffed Grouse | 40 | a | 20 |
| Eastern Phoebe | 40 | c | 43 |
| Rough-winged Swallow | 40 | - | - |
| Eastern House Wren.. | 40 | c | 30 |
| Common Tern . | 34 | r | 46 |
| Black-throated Green Warbler.. | 34 | c | 29 |
| Black and White Warbler...-- | 26 | c | 34 |
| Black-billed Cuckoo | 24 | r | 44 |
| Chimncy Swift ... | 24 | a | 26 |
| Least Flycatcher | 24 | r | 45 |
| Indigo Bunting | 24 | c | 23 |
| Barn Swallow | 24 | r | 45 |
| Bronzed Gracklc | 22 | r | 46 |
| Eastern Winter Wren. | 22 | c | 23 |
| Great Blue Heron | 20 | c | 43 |
| English Sparrow ................................... | 20 | c | 20 |

| Species | Percentage of Frequeney | Frequency | Abundance |
| :---: | :---: | :---: | :---: |
| Eastern Meadowlark | 18 | r | 38 |
| Eastern Golden-crowned Kinglet. | 18 | c | 39 |
| Eastern Red-wing | 16 | c | 42 |
| Eastern Purple Finch. | 16 | c | 39 |
| Scarlet Tanager .-.-..- | 16 | c | 36 |
| American Merganser | 14 | - | - |
| Osprey | 14 | r | 46 |
| Prairie Horned Lark | 14 | $r$ | 43 |
| Myrtle Warbler | 14 | r | 46 |
| Magnolia Warbler | 14 | - | - |
| Herring Gull | 12 | - | - |
| Ring-billed Gull | 12 | - | - |
| Northern Crested Flycatcher | 12 | 1 | 47 |
| Chestnut-sided Warbler ... | 12 | c | 21 |
| Red-breasted Nuthatch | 12 | 1 | 46 |
| Red-headed Woodpecker | 10 | c | 42 |
| Purple Martin | 10 | r | 46 |
| Veery | 10 | r | 46 |
| American Bittern | 8 | r | 47 |
| Marsh Hawk | 8 | c | 42 |
| Eastern Hairy Woodpecker. | 8 | c | 36 |
| Northern Downy Woodpecker | 8 | a | 25 |
| Bobolink | 8 | r | 43 |
| White-throated Sparrow | 8 | a | 18 |
| Tree Swallow | 8 | c | 28 |
| Migrant Shrike | 8 | - | - |
| Mourning Warbler | 8 | - | - |
| Canada Warbler | 8 | r | 43 |
| Catbird | 8 | r | 42 |
| Brown Creeper | 8 | r | 46 |
| Wilson Snipe | 6 | - | - |
| Eastern Sparrow Hawk | 6 | r | 45 |
| Great Horned Owl. | 6 | - |  |
| Yellow-bellied Sapsucker | 6 | a | 20 |
| Eastern Savannah Sparrow.. | 6 | r | 45 |
| Black-throated Blue Warbler. | 6 | $r$ | 40 |
| Blackburnian Warbler | 6 | r | 44 |
| Northern Pine Warbler- | 6 | c | 34 |
| Olive-backed Thrush | 6 | r | 41 |
| Common Black Duck | 4 | - |  |
| Sharp-shinned Hawk | 4 | r | 46 |
| Eastern Goshawk | 4 | - | - |
| Olive-sided Flycatcher | 4 | r | 46 |
| Northern Pine Siskin. | 4 | 一 | - |
| Clay-colored Sparrow | 4 | - | - |
| Northern Cliff Swallow | 4 | c | 32 |
| Bank Swallow .... | 4 | r | 44 |
| Eastern Yellow Warbler. | 4 | r | 46 |
| Pied-billed Crrebe | 2 | r | 47 |
| Piping Plover | 2 | - | - |
| Virginia Rail | 2 | r | 46 |
| Sora | 2 | - | - |
| Least Sandpiper | 2 | - | - |
| American Woodcock | 2 | 一 | - |
| Northern Red-shouldered Hawk. | 2 | - | - |
| Southern Bald Eagle. | 2 | r | 43 |
| Ruby-throated Hummingbird | 2 | c | 42 |
| Alder Flycatcher | 2 | - | - |
| Eastern Field Sparrow.. | 2 | r | 47 |
| Northern Parula Warbler. | 2 | - | - |

Table 2. Comparison of the Five Classes of Frequeney for Three Localities.

|  | Michigan |  | Kansas |  | California |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Specics | Ratio | Species | Ratio | Species | Ratio |
| A | 62 | . 59 | 133 | . 68 | 111 | . 73 |
| B | 16 | . 15 | 32 | . 16 | 20 | . 13 |
| C | 11 | . 10 | 13 | . 07 | 7 | . 05 |
| D | .. 10 | . 09 | 6 | . 03 | 5 | . 03 |
| E | 5 | . 05 | 10 | . 05 | 8 | . 05 |

The five classes, $A, B, C, D, E$, include the species of frequeney of, respcctively, 1-20 per cent, 21-40 per cent, 41-60 per cent, $61-80$ per cent, and $81-100$ per cent. Each ratio rcpresents the relation between the number of species in cach group and the number of species recorded for that area. In general the distribution of the Michigan species among the elasses of frequency resembles that of the other two loealities. The differences probably result from restrietion of observations in the former to the summer season and from the small number of days represented.

I anticipate that further tests of this method in other loealities will demonstratc its usefulness as a device for analyzing the eomposition of the avifauna. Everywhere, it is to be expected, many more species will prove to be of low frequenee than of high frequence. However, these species of low frequence may be among the most important in the make-up of the wild animal population. They are likely to be ones of great interest to their himan assoeiates. Birds of prey, large species, and the smaller raritics, even when they come in the lowest frequency elass, arc the oncs which contributc most to the attraetiveness of wilderness areas and the outdoors in general for the person who watches birds. It is the natural proportions betwcen species, as revealcd by analyses of populations, that we should strive to maintain in our eonservational activities. This original composi-tion of an avifauna is so eomplex that we can searcely hope to understand or to describe it without the aid of some simple deviee such as the one based on the Raunkiaer law. It has been demonstrated over and over that an important result of the ordinary kind of human oceupation of land is to remove the species of low frequence or to lower their frequency of occurrenec and to increase the frequeney of occurrence of a few spccies, usually oncs already common.
